## rough scan on parameter

Angle : 2, 4, 6, 8, 10 degree

magnetic field: 0.8, 1.0, 1.2, 1.6, 2.0 T

For magnetic field settings below 1.2 T, deuterons exit from the neutron exit window. Above 1.2 T, protons are prone to collisions. Therefore, a more detailed parameter scan test is conducted between 1.0 and 1.2 T at frame. see detailed in after frame2click to jump to detailed scan.

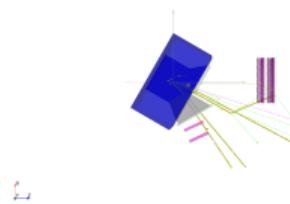

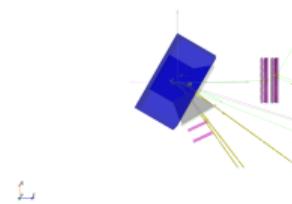

# Combined Trajectories: $B = 0.8$ T

$\theta = 2.0^\circ$

$\theta = 4.0^\circ$

$\theta = 6.0^\circ$

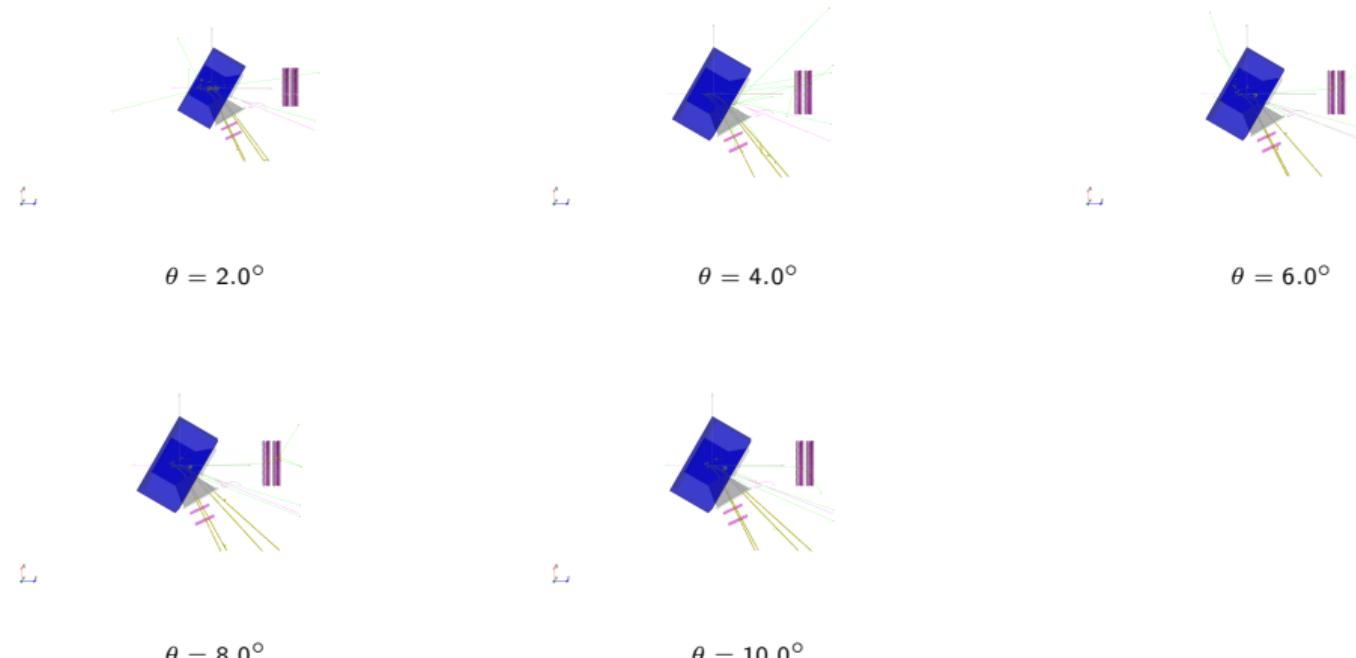

$\theta = 8.0^\circ$

$\theta = 10.0^\circ$

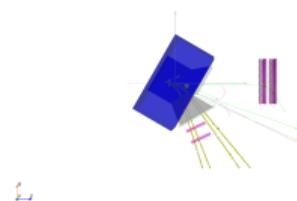

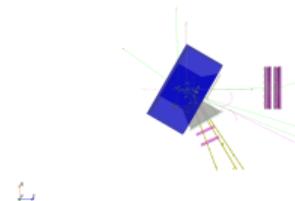

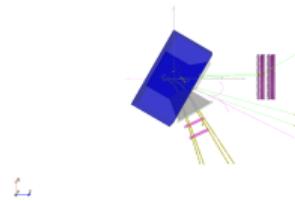

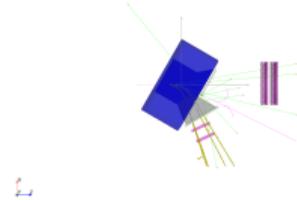

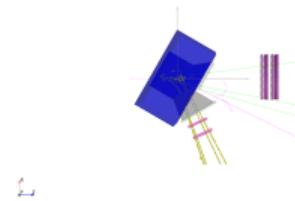

Magenta Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1$ T

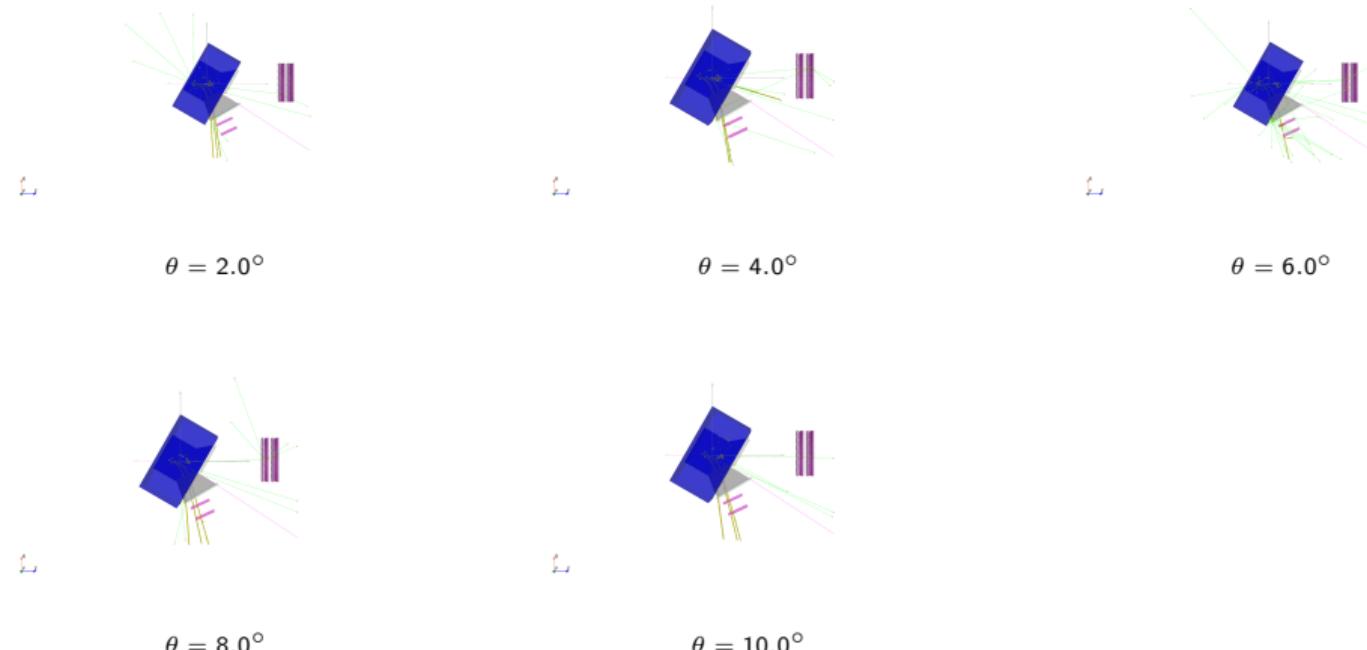

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.2 \text{ T}$

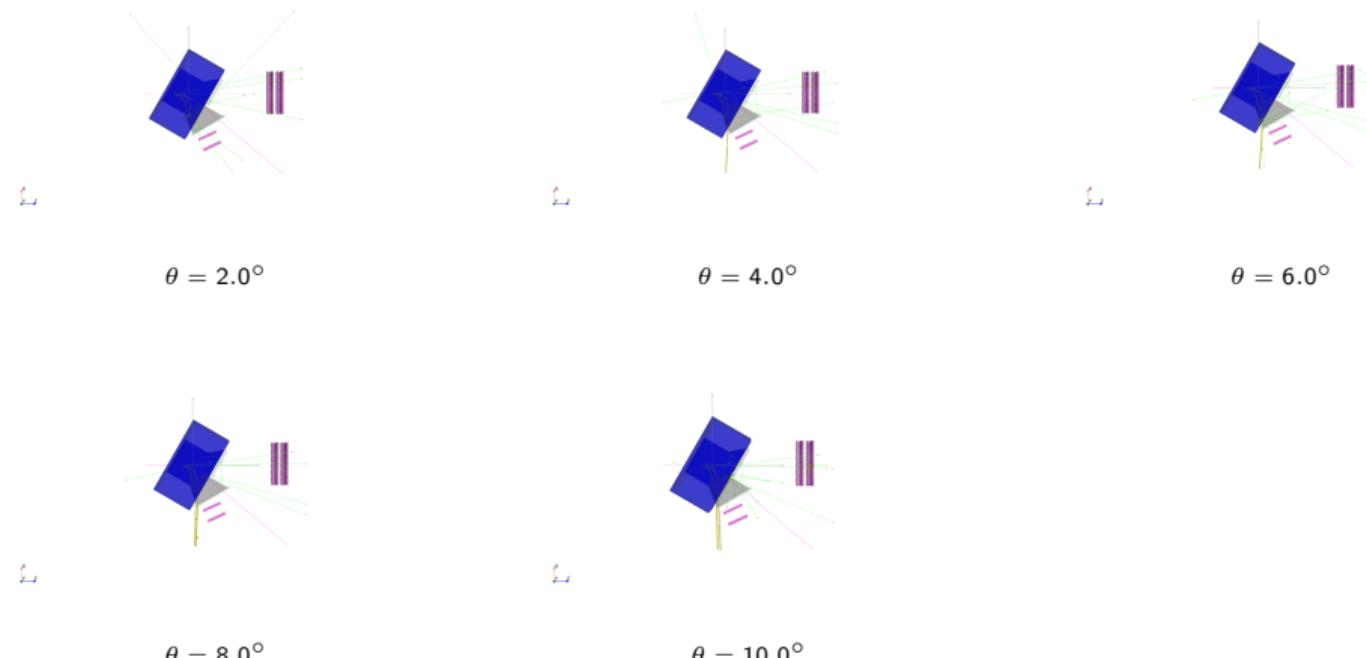

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.6$ T

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 2$ T

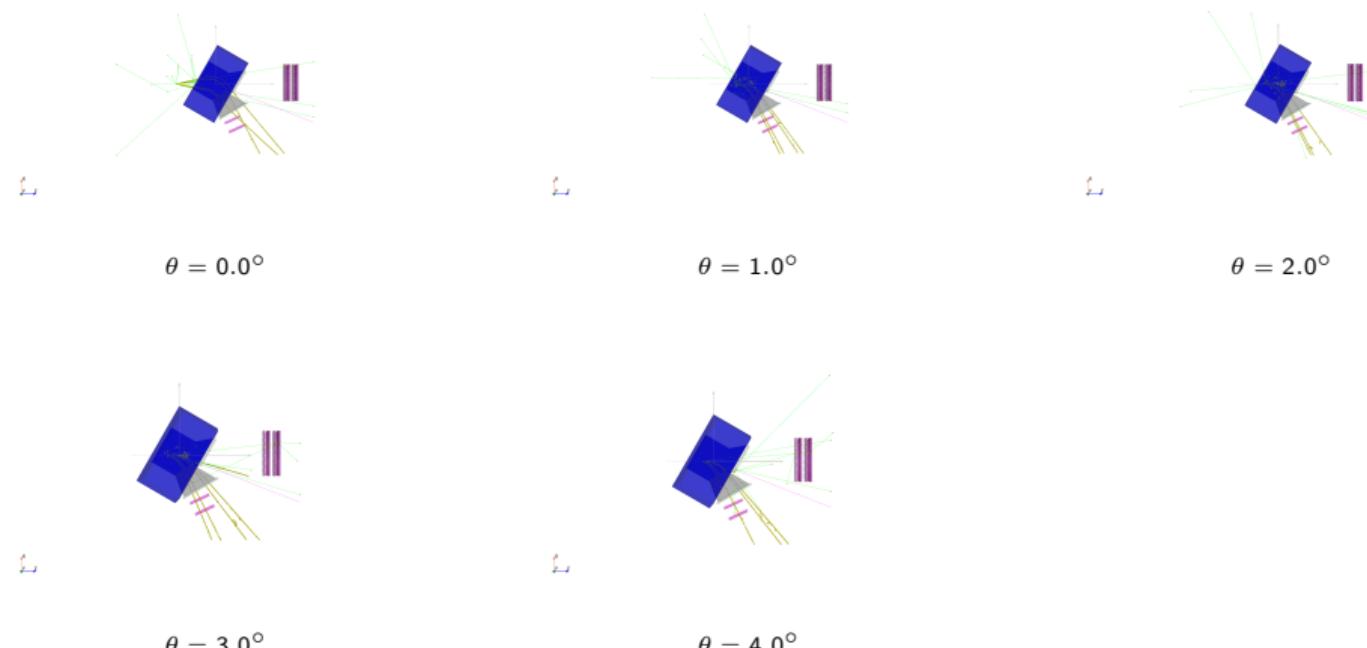

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

## more detailed config

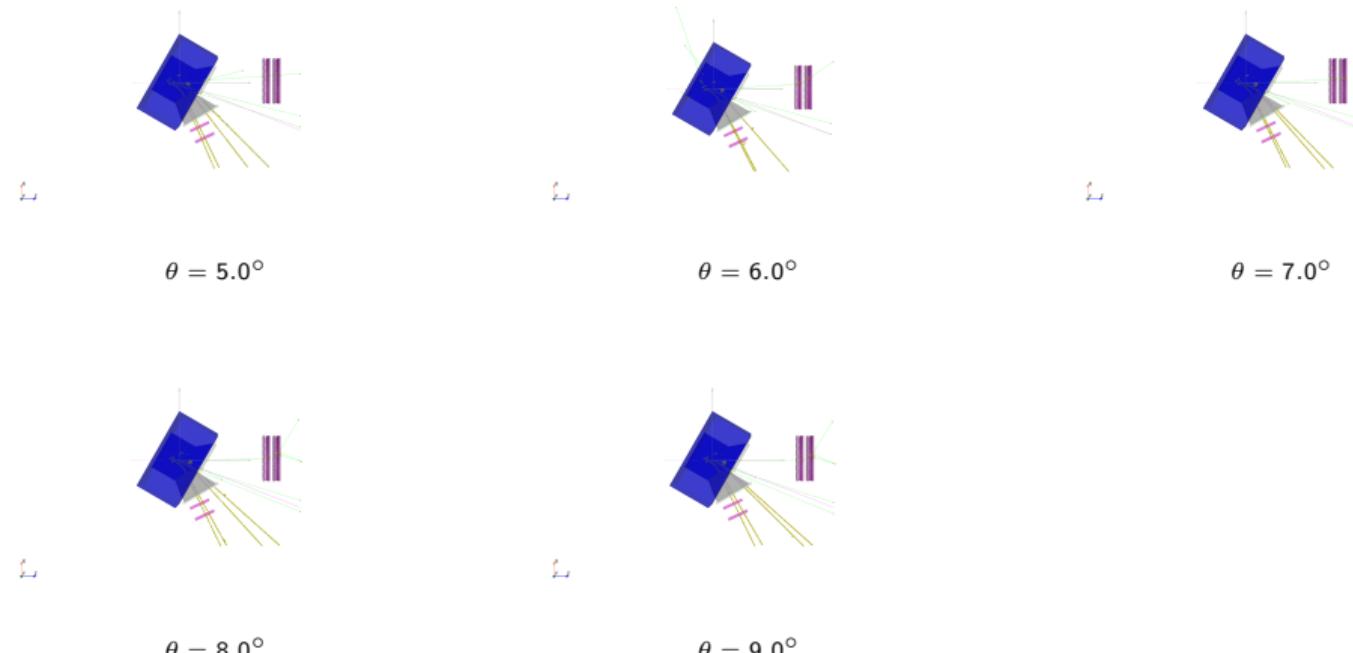

For magnetic field settings below 1.2 T, deuterons exit from the neutron exit window. Above 1.2 T, protons are prone to collisions. Therefore, a more detailed parameter scan test is conducted between 1.0 and 1.2 T.

# Combined Trajectories: $B = 1$ T

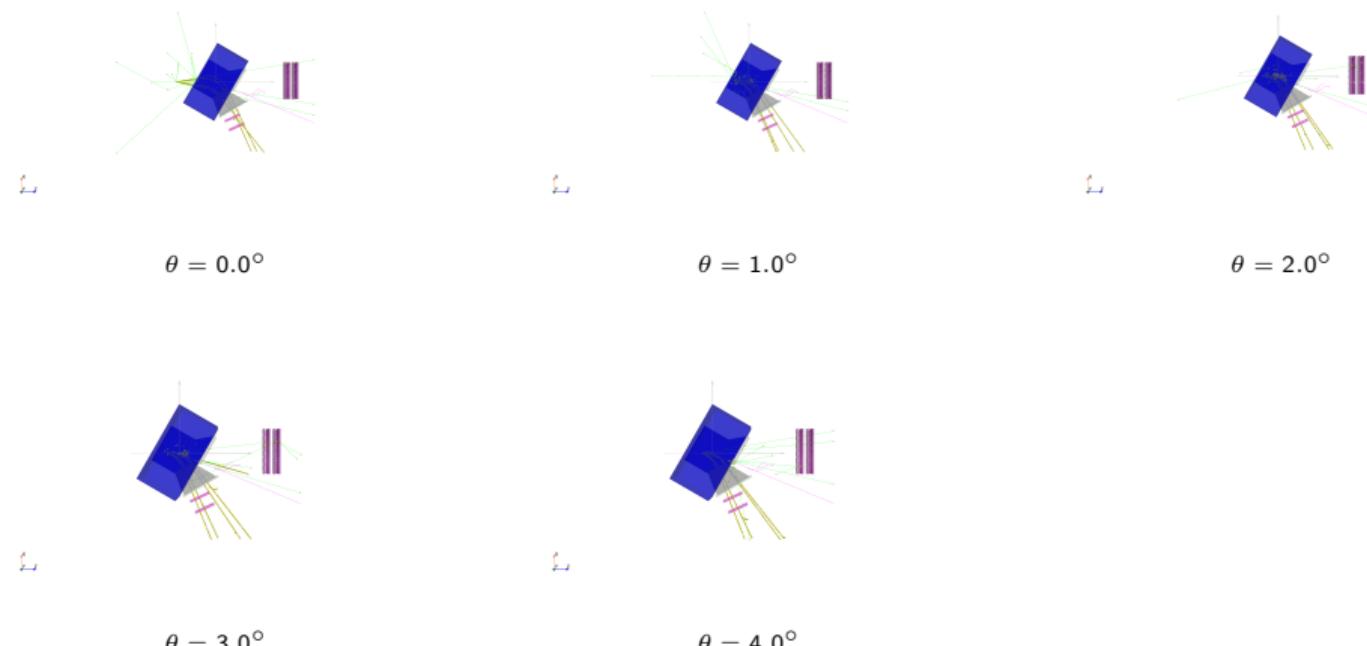

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1$ T

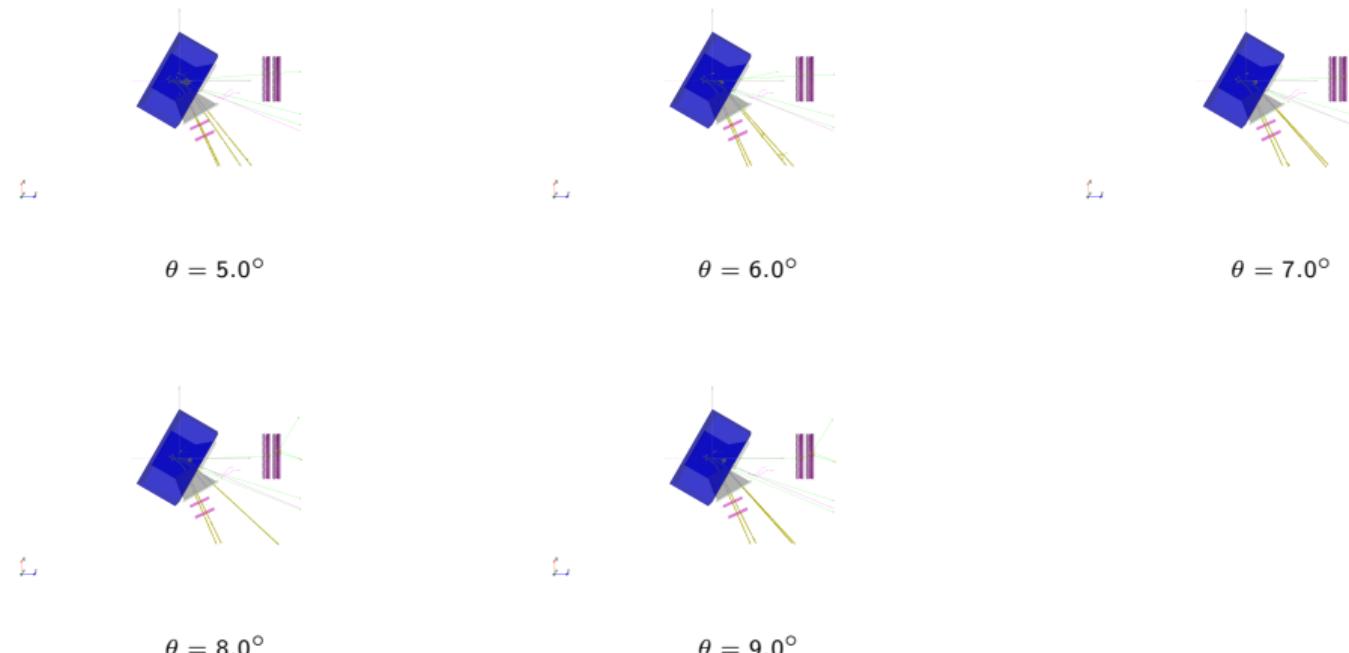

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.05$ T

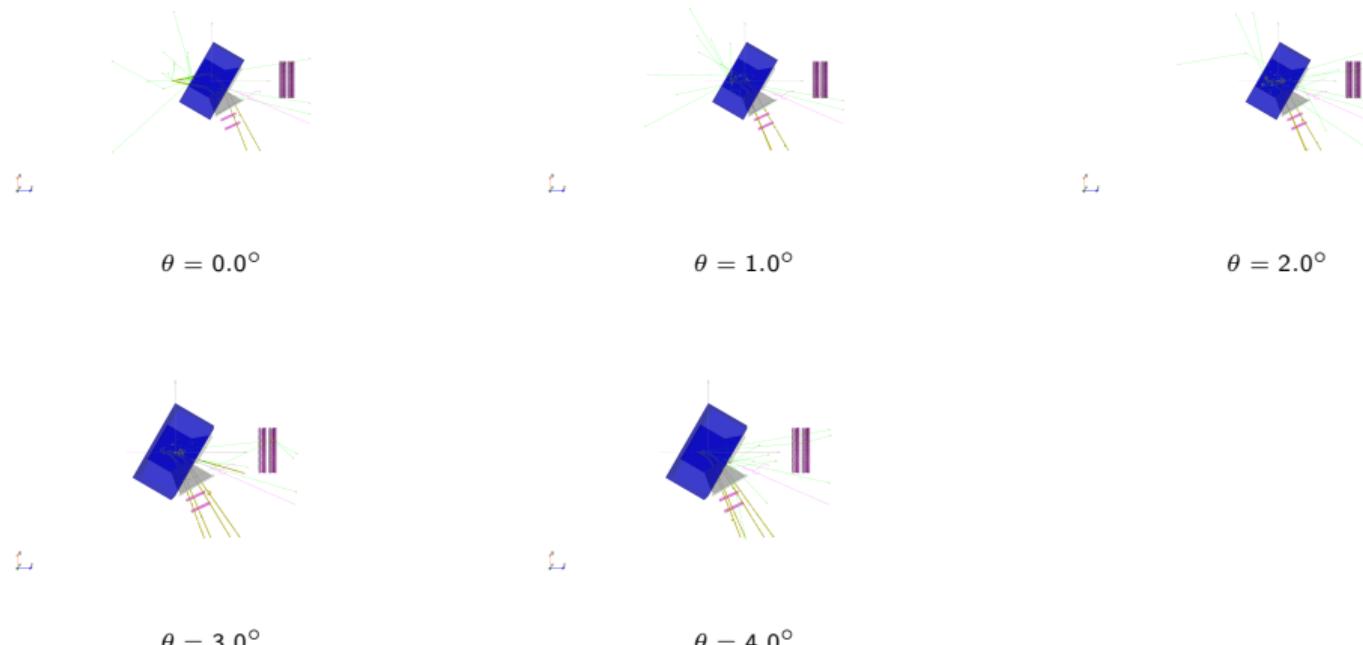

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.05$ T

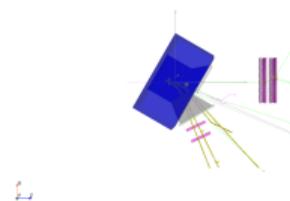

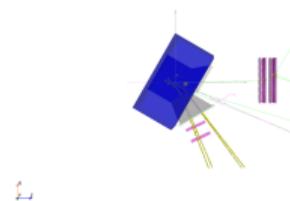

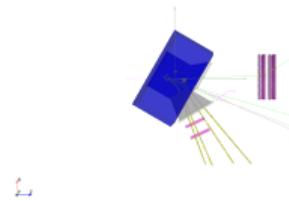

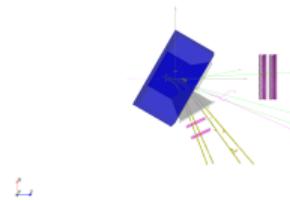

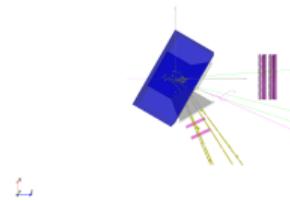

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.1$ T

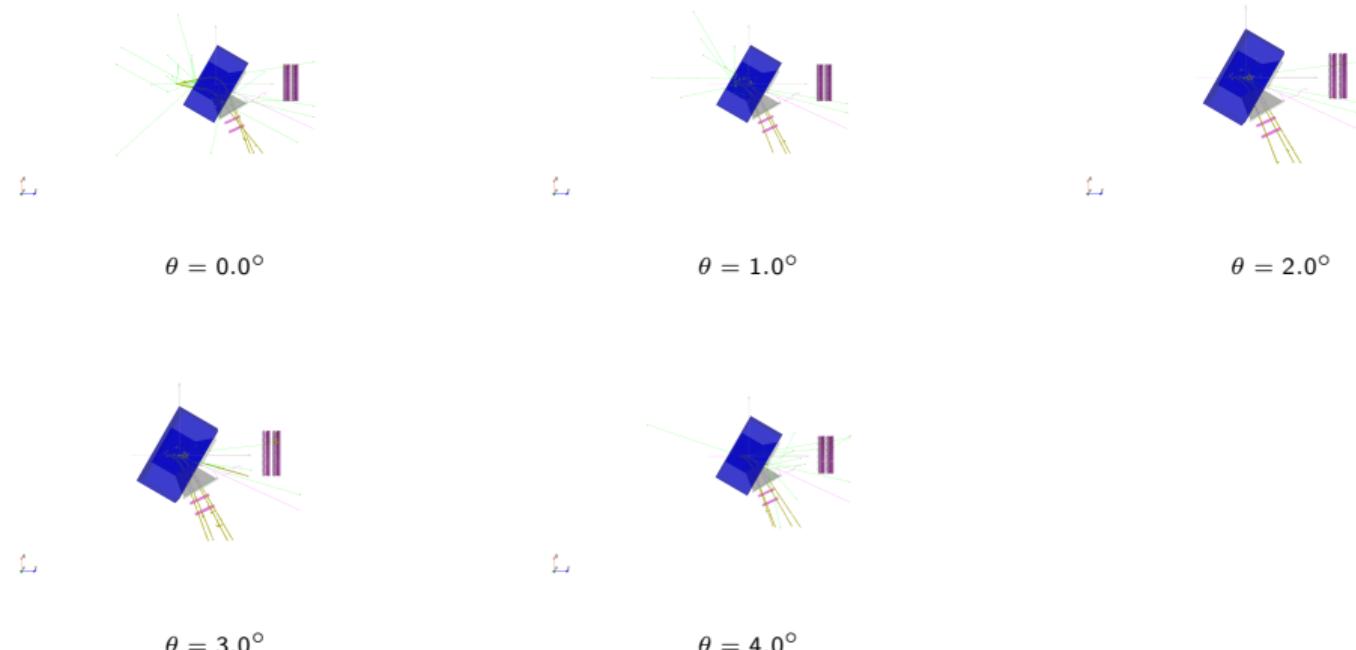

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.1$ T

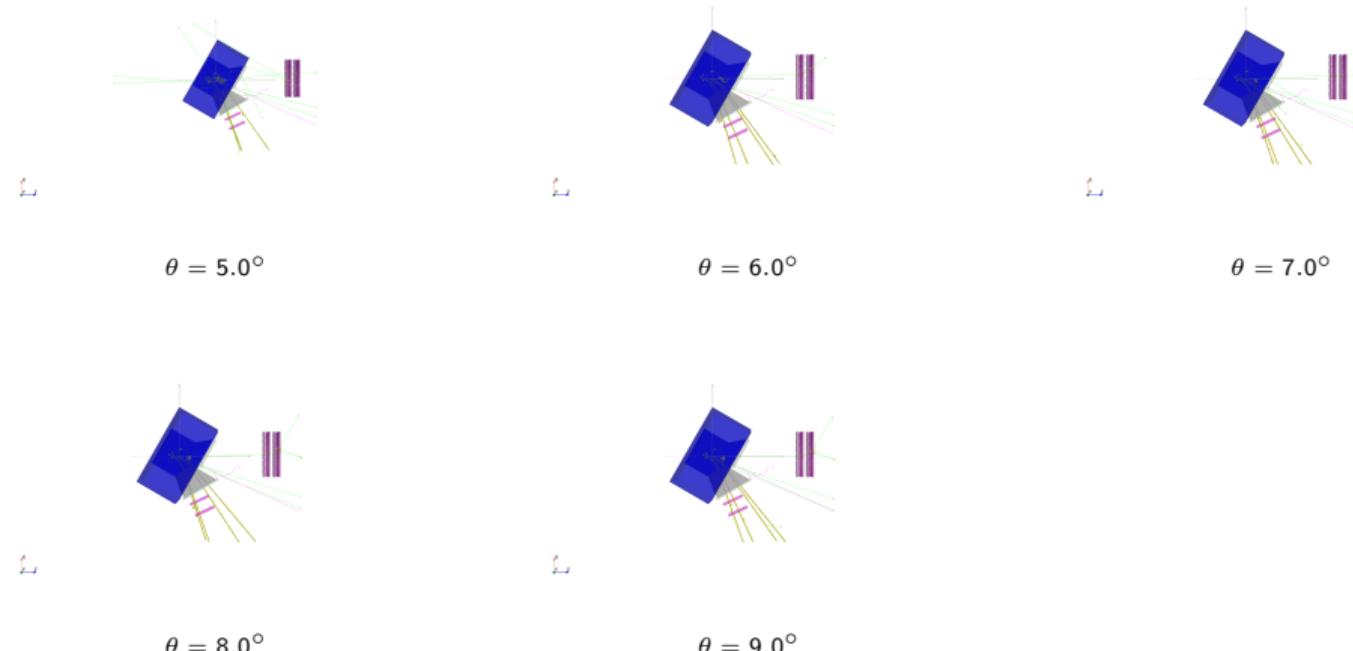

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.15$ T

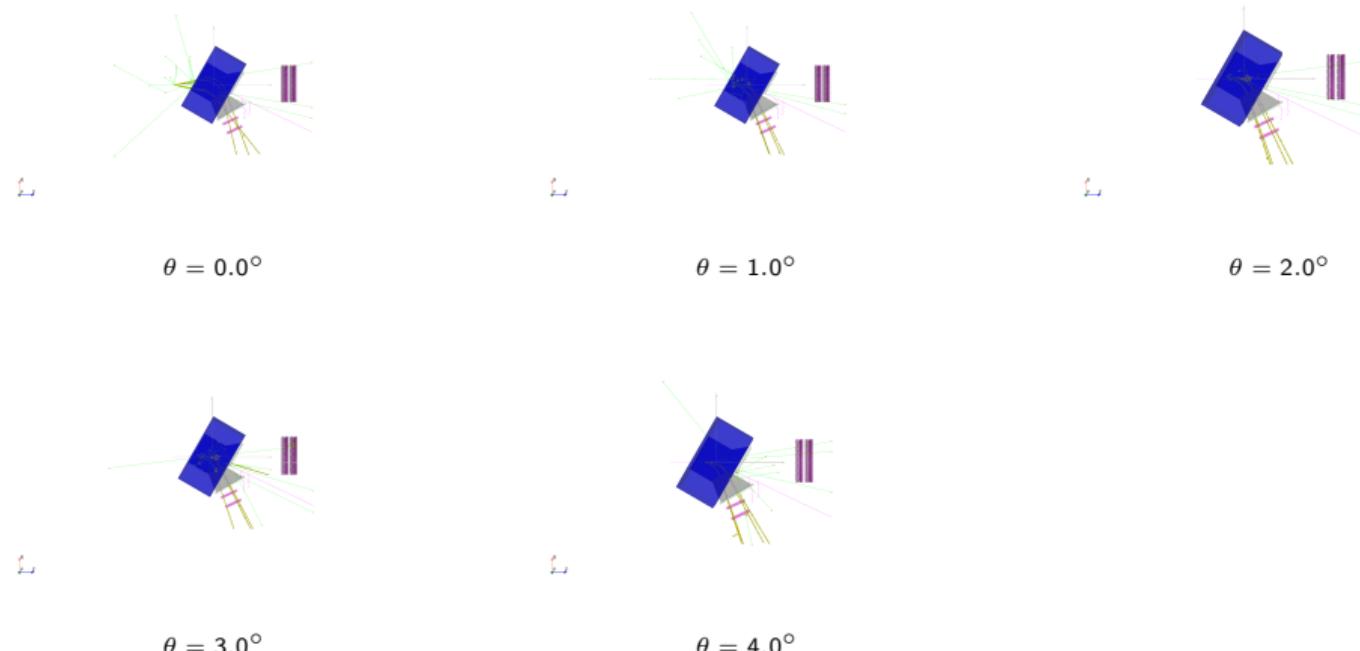

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.15$ T

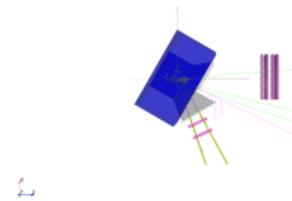

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# Combined Trajectories: $B = 1.2$ T

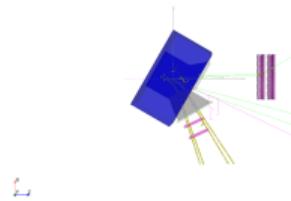

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

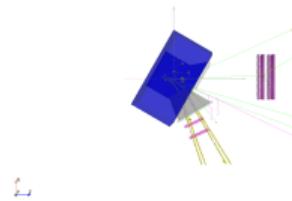

# Combined Trajectories: $B = 1.2$ T

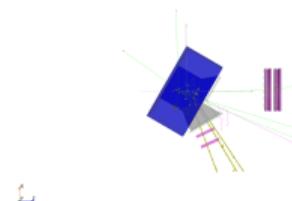

$$\theta = 5.0^\circ$$

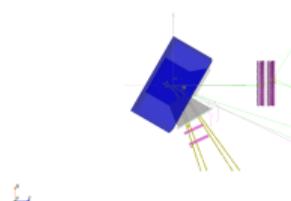

$$\theta = 6.0^\circ$$

$$\theta = 7.0^\circ$$

$$\theta = 8.0^\circ$$

$$\theta = 9.0^\circ$$

Magenta: Deuteron (380 MeV), yellow: Proton trajectories green: neutron

# final choice of config

1.15T , 3deg

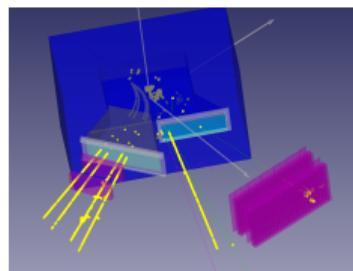

Figure: 1.15T , 3deg configuration visualization

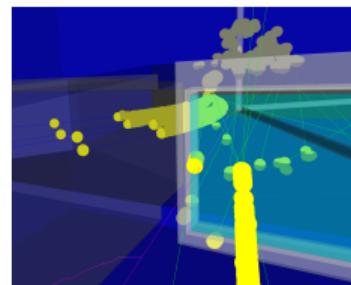

Figure: Caption

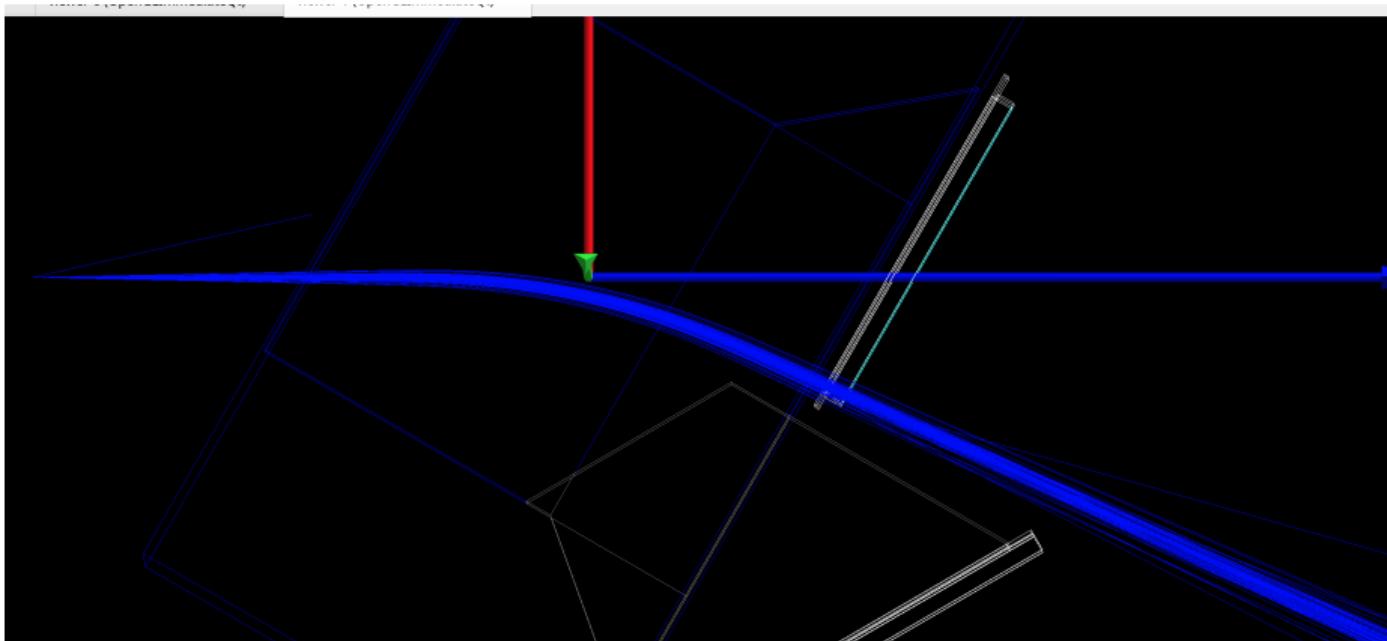

Figure: Caption

1 config

- rough scan
- detailed scan

2 backup

- target outside magnetic

3 filter

- nebula acceptance

## other config

- Target
- Vacuum exit windows (do we keep vacuum during the exp)
- Support structure inside magnet
- beam dumper
- Polarimeter mechanics

# Rationale for Target Placement

Why the target must be placed inside the magnetic field:

- **Strong  $B$ -field Case:**
  - Difficult proton track reconstruction.
- **Weak  $B$ -field Case:**
  - Risk of protons hitting the exit window.
- **General Constraint:**
  - Poor neutron geometric acceptance.

# Target Outside Magnet: 0 deg Configuration

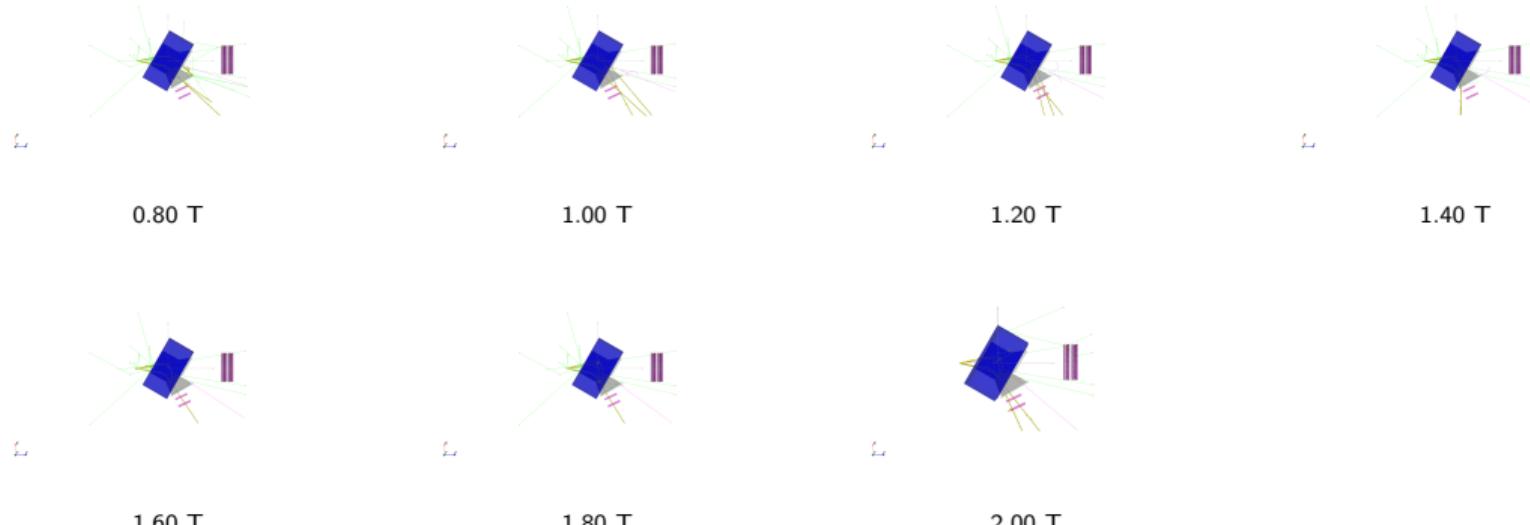

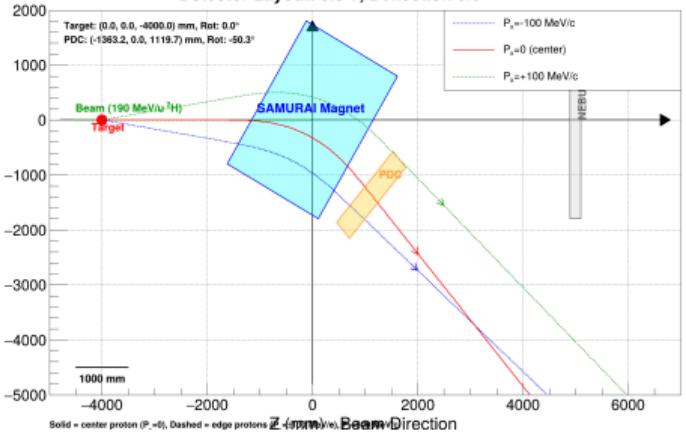

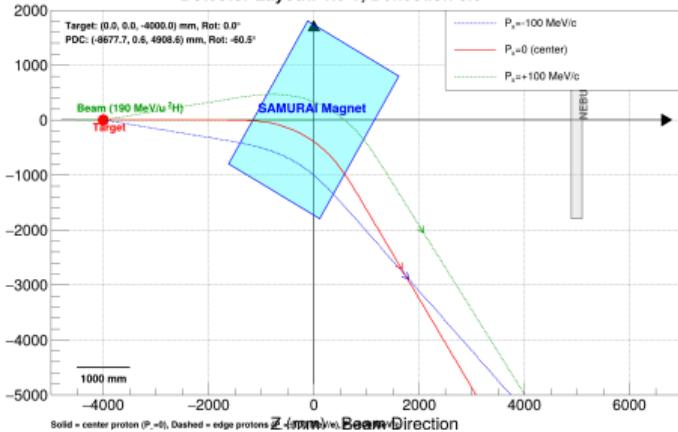

Figure: Target at (0, 0, -4m), Angle = 0 deg

- Magenta: Deuteron (380 MeV)
- Blue: Proton + Neutron ( $P_x = \pm 100, \pm 150$  MeV/c)

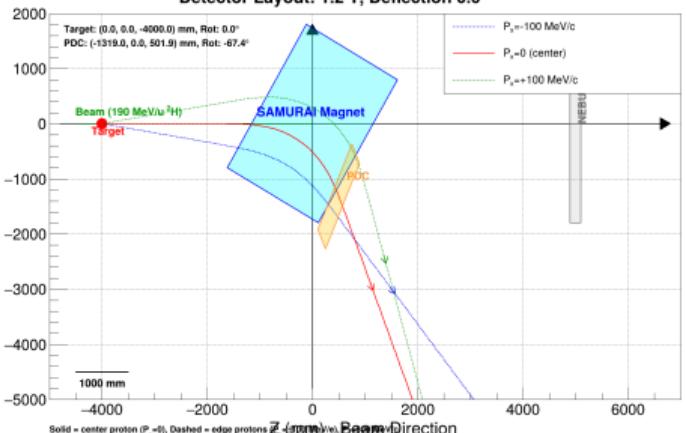

Detector Layout: 0.8 T, Deflection 0.0 °

(a) 2.40 T

(b) 2.60 T

(c) 2.80 T

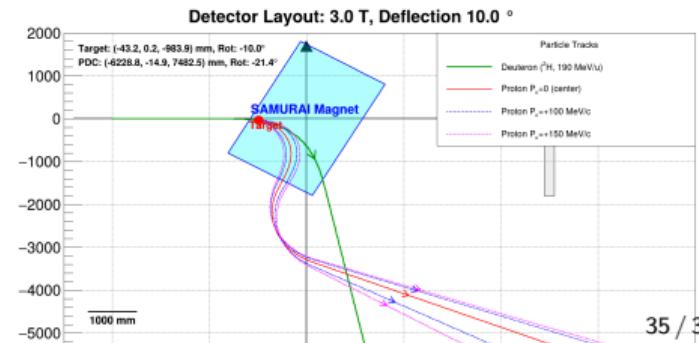

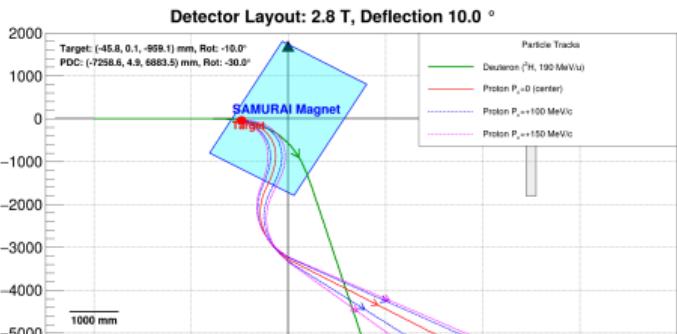

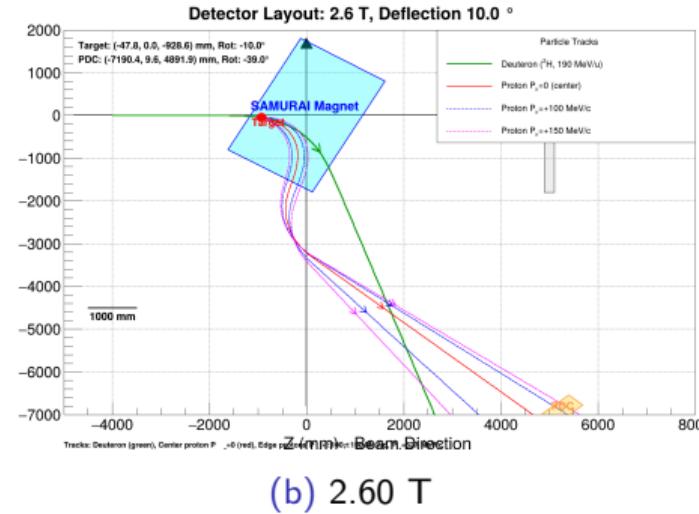

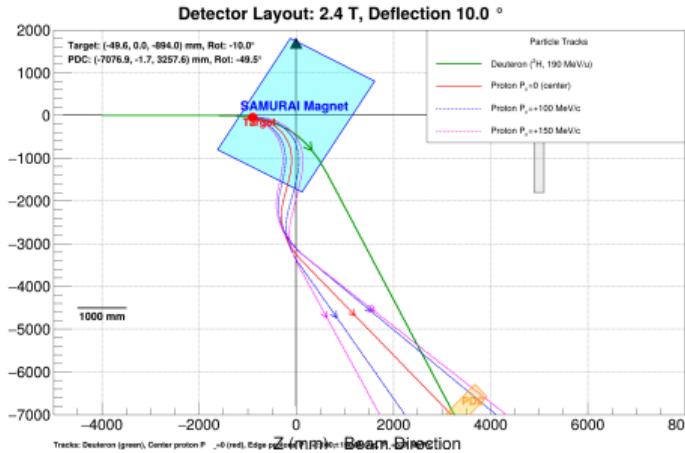

# PDC Position: 10 deg (Low Field)

# PDC Position: 10 deg (Mid Field)

# PDC Position: 10 deg (High Field)

The neutron acceptance depends on the beam bending angle. Although different magnetic field settings cause slight differences in position, the impact of the magnetic field is negligible. The angle should be smaller than  $10^\circ$ . Furthermore, the neutron distribution does not correlate with the proton changes; for neutrons within a specific region, the corresponding protons are distributed across nearly the entire space, indicating no significant correlation. For neutrons within a specific region, the corresponding protons are distributed across nearly the entire space, indicating no significant correlation.
